

SKEWNESS IN LÉVY MARKETS

JOSÉ FAJARDO

(INBMEC Business School, Rio de Janeiro)

We study different notions of skewness, and relate them, through a parameter that we find relevant in order to quantify and explain the different types of skewness encountered in market models: the “statistical skewness”, the “risk neutral skewness” and the “implied volatility skewness”. We assume that stock is driven by a time-dependent Lévy process.
